

# From Bench to Bedside: Role of Informatics

*Nagasuma Chandra*  
*Indian Institute of Science*  
*Bangalore*

# Apparent 'disconnect' among DATA pieces STUDYING THE SAME SYSTEM

***Navigating across multi-scale multi-level biological systems***

# Structuring Complexity in Engineering

Early models of engineered system behaviour are cognitive models of the system as described by experts

Engineering has used- Tacit knowledge, Rules, Experience

These help in defining physical behaviour to some extent- however knowledge in rules not sufficient

Need physical laws to be obeyed and tested with experiments

Therefore quantitative -- measurable mathematical models and simulations are needed at various fidelity levels

# Learning from Engineering

*Has a well-defined blue-print*

*Provides clues to Structuring Complexity*

Need to obtain a blue-print for biological systems as well

for

(a) Basic understanding of the living systems &

(b) Application in Medicine & Biotechnology

**BUT**

**Problems associated are**

- Too many players
- Highly complex interactions

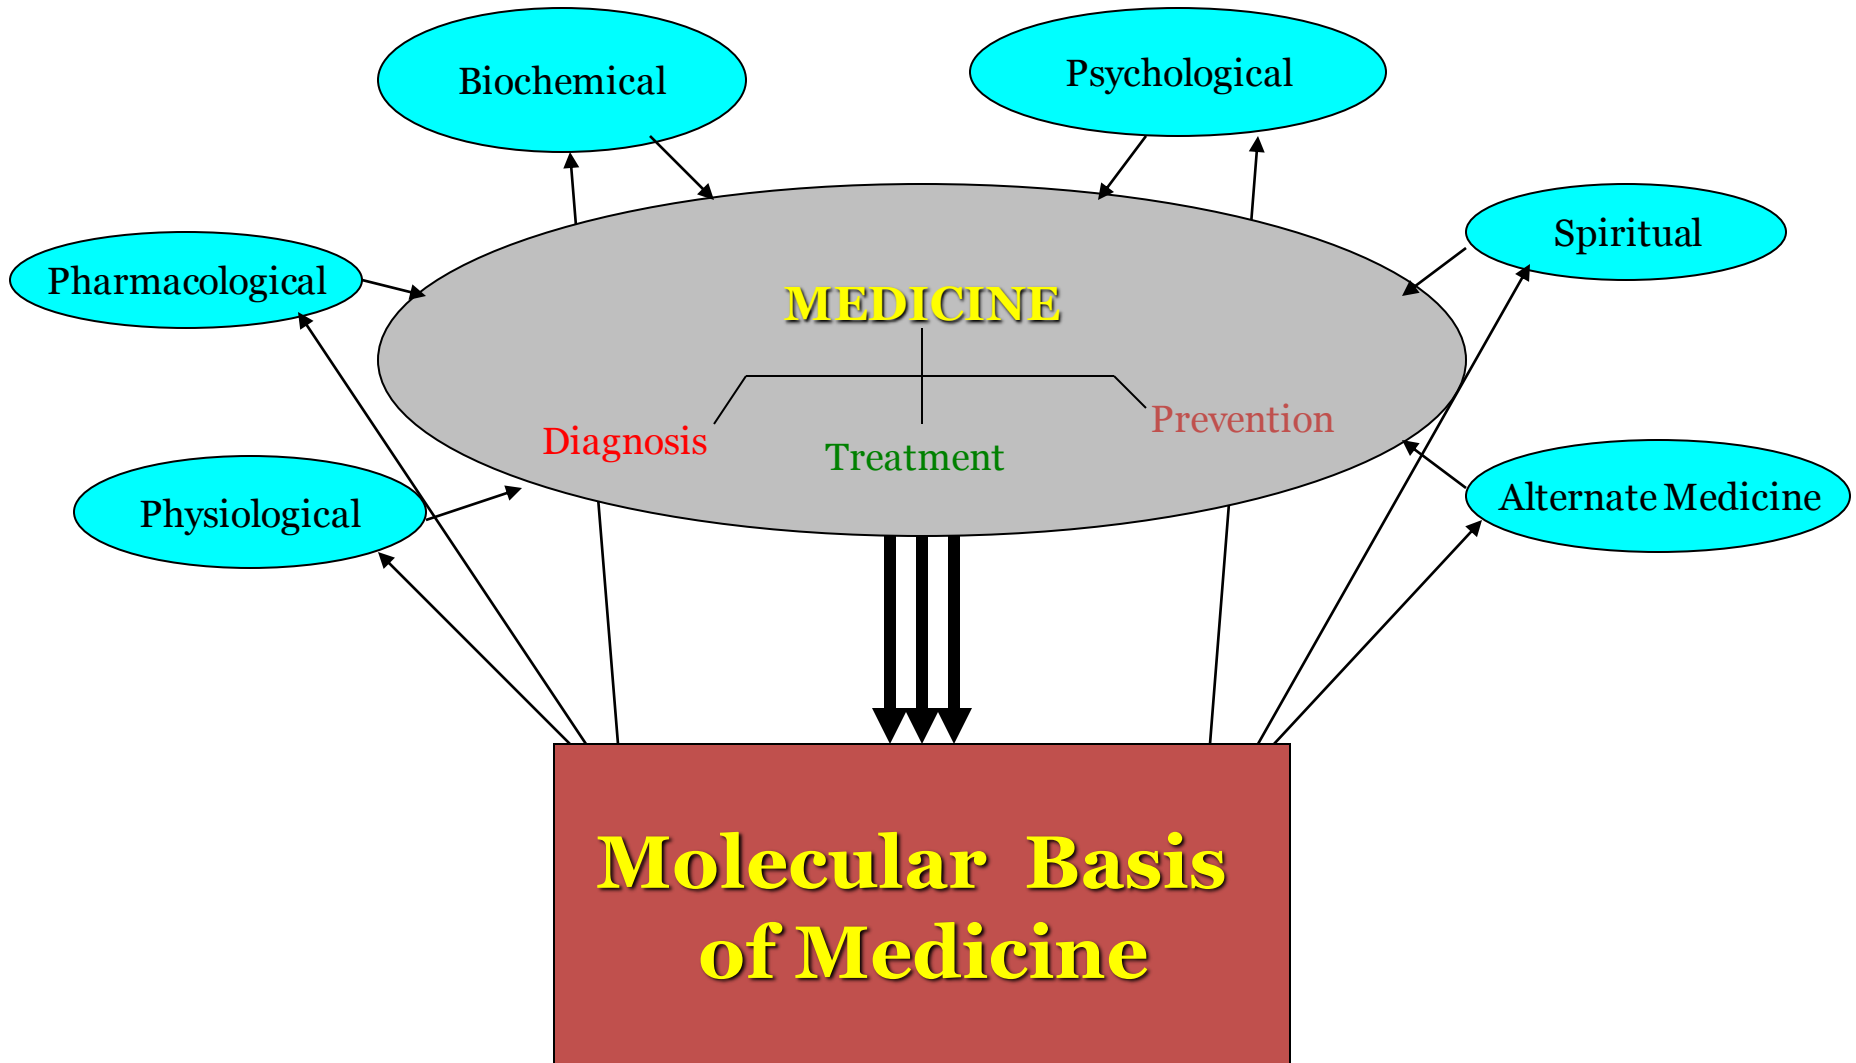

# Challenges in studying biological systems

Several challenges must be met however, in order to study biological systems.

- ❖ formulate biological questions as network amenable problems,
- ❖ reconstruct networks with appropriate resolution from available data.
  - ❖ establish relationships within each layer of data but more importantly among different levels of data,
- ❖ to identify and understand the flow of information in terms of biochemical, biophysical structural and molecular signals within a cell, leading to various biological events.

## Descriptions:

- ❖ Sequences ( $f_n$  implicit)
- ❖ Structures
- ❖ Metabolites
- ❖ Biochemical Reactions ( $f_n$  explicit)
- ❖ Regulation elements
- ❖ Network of proteins/metabolites/reactions

# Taxonomy of Models

Low granularity

High granularity

Qualitative Models

Machine Learning  
Statistical Models

Bayesian Networks

Bayesian Network of SNPs Associated with CVA

Network  
Topological Analysis

Boolean Modelling

	0;0	0;1	1;0	1;1	
a	b;c	0	1	1	0
b	a;c	1	0	0	1
c	b;b	0	1	1	1

Stoichiometric Matrix  
Flux Balance Analysis

	R1	R2	R3	R4	R5	R6	R7
A	1	-1	-1	0	0	0	0
B	0	1	0	-1	-1	0	0
C	0	0	1	0	1	-1	0
D	0	0	0	0	0	1	-1

Stochastic Modelling

Differential Equations

Molecular Recognition  
Models

Atomistic Models

# *M.tuberculosis*: A successful pathogen

Tuberculosis has been present in humans since antiquity  
(Earliest evidence in prehistoric humans – 7000 to 18000 BC)

4000 proteins

1000+ biochemical reactions; 100s signalling / regulatory events

High redundancy in the genome

Robust system

Contains several immune evasion mechanisms

Dormant state that can reactivate after decades to cause active disease

Many people infected but do not contract the disease

→ A multi-level view necessary

# COMMON DESIGN PRINCIPLES ACROSS DIVERSE EXPRESSIONS OF LIFE

- 100 trillion cells
- 3 billion base pairs
- 20000-25000 proteins
- 210 distinct cell types
- 400 billion chemical reactions every second

- 2-4 $\mu$  in length
- 0.2-0.5 $\mu$  in width

- Each cell
- 4 million base pairs
- 4000 proteins
- 1000 metabolites
- 4000 X 10000 atoms

Three dimensional structure of one protein  
Contains ~10,000 atoms

**1 Biochemical networks**

# Cellular Networks

Abstraction of the flow of information that leads to Drug  
Resistance in TB bacilli

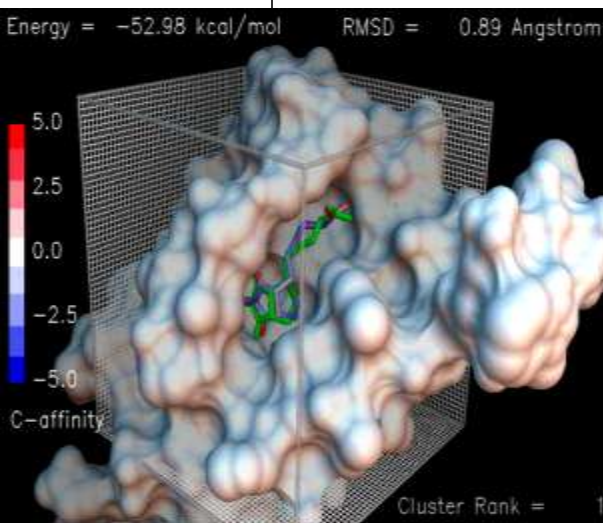

- Network of shortest paths from MAP to Resistance Genes
- 616 nodes and 1,683 edges
- Paths scored based on edge frequency, up-regulation of source and target nodes

# Structural Bioinformatics

# Virtual screening in drug discovery/design

Ligand size:  $\sim 10$ -50 atoms (flexible)  
Protein size:  $\sim 2000$ -5000 atoms (rigid)  
1 docking run:  $\sim 10^6$  energy evaluations  
on a high-end PC  
 $\Rightarrow$  CPU time  $\sim 30$ min.

Modest Ligand database:  $\sim 10^6$  compounds  
Protein molecules are NOT rigid & multiple conformations must be sampled

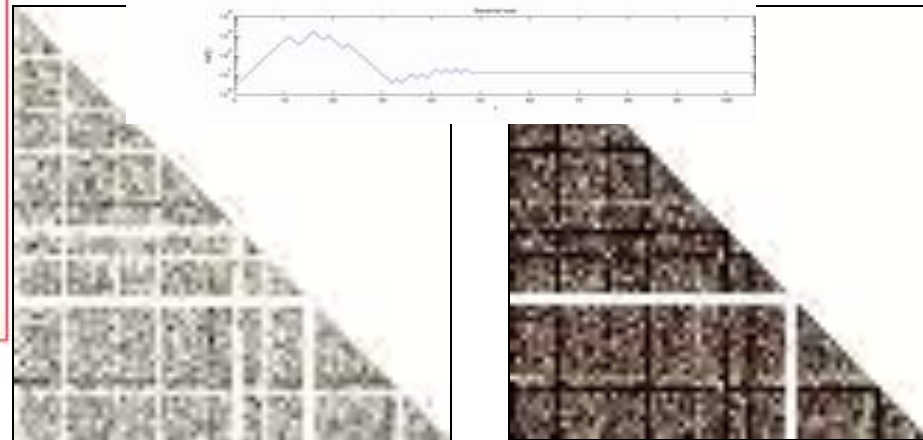

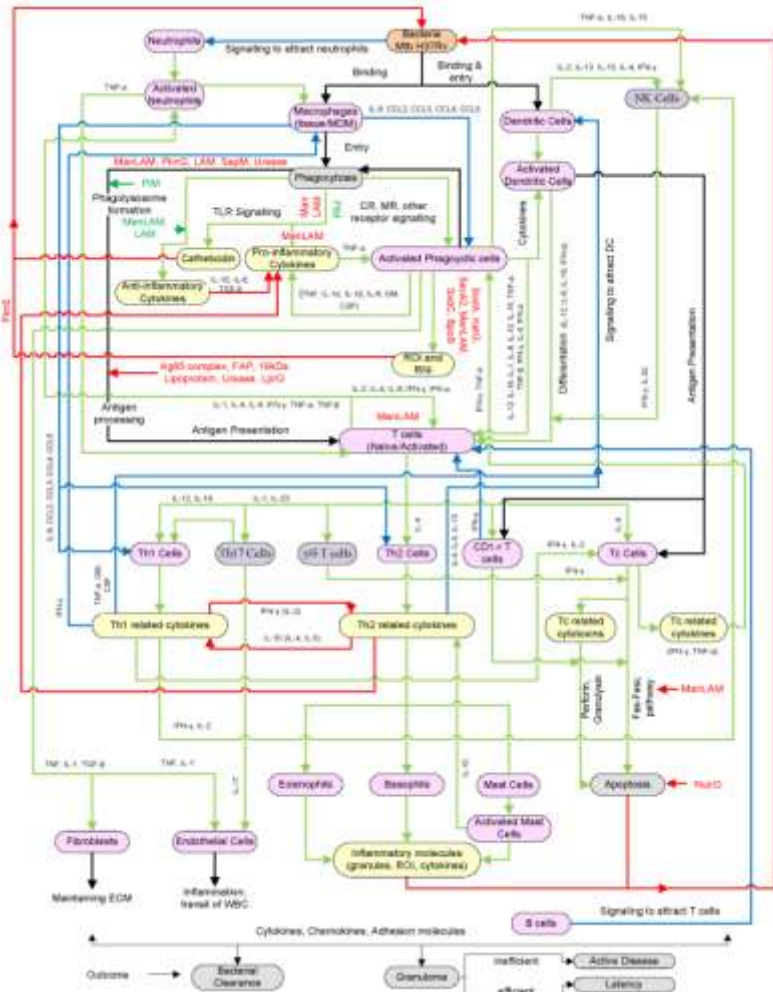

A database search requires:

$\sim 30$ min \* 10 (protein conformations) \* 1 million (ligands in database)  
 $\sim 5 \cdot 10^6$  hrs.

How about studying **several proteins?**

# Host-Pathogen Interaction Modelling: Predicting disease outcome

A Boolean model of HPIs developed, Simulations to capture a variety of scenarios  
 Raman, Bhat & Chandra, Mol. Biosyst, 2010

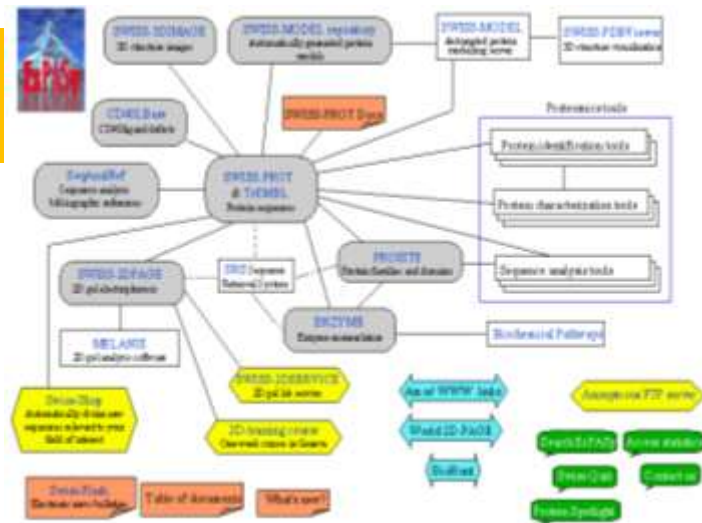

# Biological Design-

Outcome of a random  
'tinkering' process (Evolution)

Engineering – Built on  
purpose with a pre-designed  
blue-print

# Data Integration

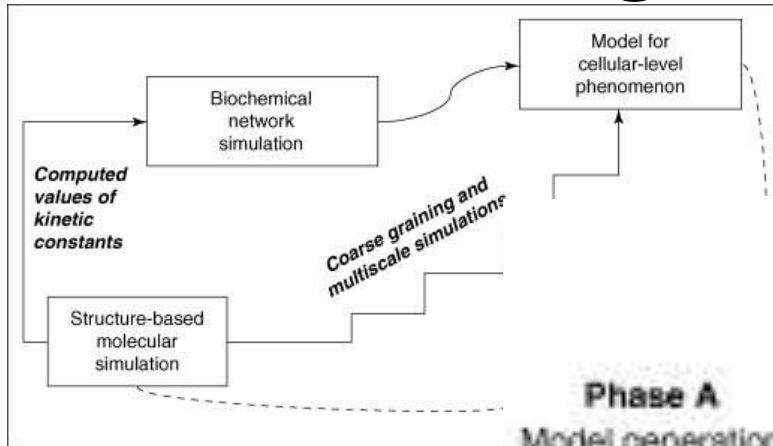

- Data Resources- Primary & Derived Databases
  - » cross mapping- across databases
- Data descriptions
- Data representation-Data structures, Syntaxes
- Data Integration
  - Data InterRelationships-Ontologies
  - Data flow pipeline
  - A biology workbench??
- Data Visualization
- Simulation tools- Iterative with model development

# Potential of Translation Systems

## Biology

- Patient GENOTYPE profile – molecular, Biochemical, life style, gene history
- Informatics- Identify disease, disease type, patient type, predict risk of patient for a given disease
- Understand molecular basis of disease, identify causative proteins, biochemical, signalling pathways
- Identify optimal strategy for tackling disease
- Choose best therapeutic intervention tool, drug, vaccine, other clinical tools
- Predict outcome of therapy with the chosen agent-PHENOTYPE
- Pharmacogenomics, Personalized prescriptions
- Monitor patient, populations, Learn...
